

Evaluation Report – BC Hydro EV Charging & Grid Load Optimization

Answered Problem Sections: 4.5/5

I think he actually answered both parts of what I asked for. For Problem 1, he went through Option A, B, and C separately and used the sessions, consumption, and authority_load data the way I wanted, without just picking a winner for me. The good point is he was upfront about where the data runs out, like saying there's no neighborhood/transformer ID to actually judge Option B, and no income data to check the equity concern in Option A. That's exactly what I asked for in my proposal. He could improve by digging a little more into the consumption.csv and authority_load.csv datasets instead of using them mostly for framing, since I gave him three datasets and one of them barely gets used quantitatively.

Technique judgment: 5/5

I said this was unsupervised and he treated it that way the whole time, no fake target variable or forced labels. He ran both K-Means and DBSCAN like I asked instead of just picking one, and he justified dropping energy_kwh from the feature matrix because of that -1.00 correlation with battery_soc_start, which I think shows good judgement, not just following instructions blindly.

Evaluation/interpretation quality: 4.5/5

He didn't just report silhouette scores, he explained why DBSCAN's higher score doesn't mean it's "better," which I really liked because it connects back to what I actually need (interpretable driver groups), not just a leaderboard number. He also tied the k=4 clusters back to actual rebate targeting, like the "peak-hour fast chargers" group. He can improve by being a bit more decisive in the final recommendation section, it's slightly hedged.

Communication: 4/5

The executive summary is written for me, not for another data scientist, which I appreciate a lot. The rest of the notebook is pretty technical though, so if I hadn't read the summary first I probably would've gotten lost.

Overall feedback: From what I see, he did a great job overall, he stayed honest about the data's limits, matched the technique to how I worded the problem, and gave me a summary I could actually bring to a meeting.
